

# Lab\_7

---

Create a new project that includes:

class-template my\_vect (file my\_vect.h)  
my\_mess error and message handling class (my\_mess.h, my\_mess.cpp)  
interface class my\_interf (my\_interf.h, my\_interf.cpp).  
my\_coord data class (my\_coord.h, my\_coord.cpp)

Class my\_vect contains:

```
T *dat;           //pointer to the data of generic type, array of container
size_t ndim;     //dimension of array to be allocated dynamically
size_t last;      //index of the first empty position in array
my_mess msg;     //declaration of the message object

public:
    my_vect(size_t dm); //constructor - allocates memory for array of T type
                        //on dm elements.
    my_vect() { dat = NULL; ndim = last = 0; }
    ~my_vect();          //release of array
    void init(size_t dm); //allocates memory for array with dm elements,
                        //if dat = NULL (after default constructor)
    T *get_begin();     //returns pointer T * to the begin of array
    T *get_end();       //returns pointer T * to the dat[last]
    void disp();        //display san array to monitor
    void push(const T &ob); //add an element of the type T to first empty position
                            //of array
    T *pop();           //returns pointer to the last element of the filled
                        //part of array or NULL, if an array is empty.
    T & operator [] (const size_t ind); //0 <= ind < last
    void remove(size_t ind); //erase an element of array with index ind and
                            //compresses array
private:
    bool alloc();        //dynamically allocates array
    bool realloc();      //enlarge the dimension of array ndim and reallocate
                        //memory.
```

Add the realization of the template class and place the template function Find (...) in this file.

Include error and message handling in my\_mess.cpp and my\_mess.h files.

my\_mess.h:

```
class my_mess
{
public:
    enum MY_MESSAGE
    {
        ERR_ALLOC_MEM,      //memory allocation error
        WARN_ARR_FULL,     //array is full (last > ndim)
        WARN_ARR_EMPT,     //array is empty (last = 0)
        WARN_ARR_UNKN,     //invalid operation (interface)
        TOT_NUMB           //total number of messages
    };

    static char *strtab[TOT_NUMB]; //array of messages

public:
    void mess(enum MY_MESSAGE ms); //When this function is called, the message
```

```

//appears on the screen. If this is an error,
//the calculation must be finished, if not,
//continue. ms - enumeration member that gives
//the message number};

```

my\_mess.cpp:

```

char *my_mess::strtab[] =
{
    "E  memory alloc error",           //ERR_ALLOC_MEM
    "W  array is full",                //WARN_ARR_FULL
    "W  array is empty",               //WARN_ARR_EMPT
    "W  invalid operation"            //WARN_ARR_UNKN
};

void my_mess::mess(enum MY_MESSAGE ms)
{
    if(strtab[ms][0] == 'E')
    {
        cout << "ERROR: " << &strtab[ms][1] << endl;
        system("pause");
        exit(1);
    }
    else if(strtab[ms][0] == 'W')
    {
        cout << "WARNING: " << &strtab[ms][1] << endl;
    }
}

```

my\_interf.cpp, my\_interf.h – comprise an interface handling.

my\_interf.h:

```

#include "my_vect.h"
#include "my_coord.h"

class my_interf
{
    enum MY_INTERF
    {
        MY_INTERF_PUSH,
        MY_INTERF_POP,
        MY_INTERF_DISP,
        MY_INTERF_FIND,
        MY_INTERF_FINISH,
        MY_INTERF_TOT
    };

    my_vect<my_coord> vect;
    static char *str_interf[]; // messages displayed on the monitor
    my_mess msg;

public:
    bool run;

    my_interf();
    my_interf(size_t dim);
    void menu();
    void push();
    void pop();
    void disp();
    void find();
    void finish();

```

```

    void default();
};

my_interf.cpp:
my_interf::my_interf(size_t dim)
{
    vect.init(dim);
    run = true;
}

void my_interf::menu()
{
    int i;
    for(i=0; i<MY_INTERF_TOT; i++)
    {
        cout << str_interf[i] << endl;
    }
}

void my_interf::push()
{
    my_coord ob(0,0);
    cin >> ob;
    vect.push(ob);
}

void my_interf::pop()
{
    my_coord *ptr = NULL;
    ptr = vect.pop();
    if(ptr)
    {
        cout << *ptr;
    }
    else
    {
        msg.mess(my_mess::WARN_ARR_EMPT);
    }
}

void my_interf::disp()
{
    vect.disp();
}

void my_interf::find()
{
    my_coord ob(0, 0);
    my_coord *ptr = NULL;
    cout << "input x, y - object for search\n";
    cin >> ob;
    ptr = vect.get_begin();
    size_t dist;
    while(ptr)
    {
        ptr = Find(ptr, vect.get_end(), ob);
        if(ptr)
        {
            dist = ptr-vect.get_begin();
            cout << "it = " << dist << " " << *ptr;
            ptr++;
        }
        else
            cout << "search end\n";
    }
}

```

```
    }
}
```

my\_coord data class: my\_coord.h:

```
class my_coord
{
    double *pcoord; //pcoord[0] - x coordinate; pcoord[1] - y coordinate
    my_mess msg;
public:
    my_coord() { alloc(); pcoord[0] = pcoord[1] = 0; }
    my_coord(double x, double y);
    ~my_coord();
private:
    void alloc();
};
```

Funkcja main:

```
int _tmain(int argc, _TCHAR* argv[])
{
    int op; //operacje
    my_interf ifc(1000);

    while(ifc.run)
    {
        ifc.menu();
        cin >> op;
        switch(op)
        {
            case MY_INTERF_PUSH: //push
                ifc.push();
                break;
            case MY_INTERF_POP:
                ifc.pop();
                break;
            case MY_INTERF_DISP:
                ifc.disp();
                break;
            case MY_INTERF_FIND:
                ifc.find();
                break;
            case MY_INTERF_FINISH:
                ifc.finish();
                break;
            default:
                ifc.default();
        };
    }

    system("pause");
    return 0;
}
```
